Report Overview

Pigment inks are fixed by creating adhesion of the pigment with the fabric. Pigment inks contain binder which typically is polymer-based compound. During the fixation process this polymer is heated to a temp where it plasticizes (gets converted to semi solid-state) and then creates a bond between fibers of fabric and pigment particles in the ink. This in a sort creates a physical bond between the pigment particle and the fabric. This binder plays a highly critical role in the performance of the pigment inks. Right from ink stability, nozzle jetting performance, preventing clogging of the print-head to ensuring fastness of the inks on fabric, having minimum feel are various things depending on the binder.
