Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Pilot Burner competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of pilot burners will reach 369,400 units, with an average selling price of US\$834.91 per unit. A pilot burner is a direct-fired combustion device that uses a specialized nozzle to efficiently mix fuel and air before or during the initial stages of combustion. It is a typical application of premixed or partially premixed combustion technology. Its core feature lies in the precise design of the nozzle structure (such as multi-hole nozzles, swirl vanes, or Venturi tubes). By controlling the flow rate, pressure, and mixing ratio of fuel and air, a uniform premixed gas is formed at the nozzle outlet, achieving rapid ignition and stable combustion. Combustion efficiency can reach over 98%. Furthermore, precise control of the air-fuel ratio (typically an excess air coefficient of 1.05-1.2) reduces nitrogen oxide (NO_x)

The global Pilot Burner market size was estimated at USD 308.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
