### Report Overview

Pilot shut-off valve is a valve used to control gas flow in gas control systems. It is usually a small valve installed in the pilot pipeline of the gas control system to control the gas flow to the main burner. The pilot shut-off valve is designed to automatically cut off the airflow to the pilot burner in the event of pilot flame failure. This is an important safety function as it can prevent unburned gases from accumulating in the combustion chamber, leading to dangerous explosions. When the pilot flame extinguishes, the thermocouple or flame sensor in the system detects no heat and sends a closing signal to the pilot shut-off valve. This cuts off the airflow to the pilot burner, which in turn cuts off the airflow to the main burner.

This report provides a deep insight into the global Pilot Shut-off Valve market covering all its essential aspects.
