Abstracts

PIM (Passive Intermodulation) testing service is a professional technical service used to evaluate the ability of passive components (such as antennas, filters, combiners, connectors, etc.) in wireless communication systems to generate nonlinear distortion (intermodulation products) in strong signal environments. Its core goal is to ensure that the equipment will not cause signal quality degradation, communication interruption or system capacity limitation due to intermodulation interference in complex electromagnetic environments. The PIM phenomenon originates from the nonlinear current-voltage characteristics caused by metal contact points, surface oxide layers or material defects in passive components. When multiple strong signals (such as 4G/5G base station signals) pass through the device at the same time, intermodulation products (such as third-order and fifth-order intermodulation) with frequency combinations that are integer multiples of the input signal may be generated, interfering with adjacent channels or receiving frequency bands. PIM testing service is a key link in ensuring the performance of wireless communication systems. Through scientific and rigorous testing processes, it can effectively identify and eliminate the hidden dangers of nonlinear distortion in passive components.

The global PIM Testing Services market size was estimated at USD 381.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
