Report Overview

Pipe flanges are one of the most used connection types for pipes. These connections consist of three different parts: the pipe flange, a gasket, and bolting. They are used for various industrial applications, pressure classes, and media. They can connect piping in a system, connect components such as valves, containers, vessels, and many more applications. These connectors benefit from a straight-through connection without loss of flow or pressure. This article explores the most common pipe flange variants, their uses, and their most commonly used applications. A flange is a method of connecting pipes, valves, pumps and other equipment to form a piping system. It also provides easy access for cleaning, inspection or modification. Flanges are usually welded or screwed. Flanged joints are made by bolting together two flanges with a gasket between them to provide a seal.
