### Report Overview

Heat tracing has been widely used as an effective pipeline (storage tank) insulation and antifreeze solution. Its working principle is to dissipate a certain amount of heat through the heating medium, and supplement the loss of the heated pipe through direct or indirect heat exchange, so as to meet the normal working requirements of temperature rise, heat preservation or antifreeze. In the 1970s, the U.S. energy industry proposed the idea of using electric heat tracing to replace steam heat tracing. At the end of the 1970s and the beginning of the 1980s, many industrial sectors, including the energy industry, had widely promoted electric heat tracing technology, replacing steam heat tracing with electric heat tracing. The development of electric heat tracing technology has developed from traditional constant power heat tracing to self-controlling electric heat tracing with conductive plastic as the core.
