## Abstracts

The pipe internal welding machine is an automated equipment specially used for inner wall welding in pipeline engineering. It is mainly used to complete the welding task of the root welding layer after the pipe is butt-jointed, ensuring the sealing, strength and quality consistency of the inner wall weld of the pipe. The pipe internal welding machine is usually installed inside the pipe. After the pipe joint positioning is completed, the welding operating arm automatically completes the 360° circumferential seam welding. It has the advantages of high efficiency, high weld quality and good stability. Especially in the field working environment, it significantly reduces the dependence on manual technology and improves the level of construction mechanization. In recent years, technologies such as intelligent control, image recognition and weld tracking have also been integrated into the equipment, making the internal welding machine more intelligent, efficient and safe.

The global Pipeline Internal Welding Machine market size was estimated at USD 552.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
