Abstracts

PIR-based motion detectors are electronic devices that utilize passive infrared (PIR) sensors to detect movement within their field of view by measuring changes in infrared radiation emitted by objects, primarily warm-bodied entities such as humans or animals. These sensors operate on the principle that moving objects cause fluctuations in thermal energy patterns, which are converted into electrical signals to trigger an alarm, activate lighting, or initiate other automated responses. Characterized by their non-invasive nature, energy efficiency, and reliability in distinguishing between ambient environmental changes and actual motion, PIR detectors are widely employed in security systems, lighting control, energy management, and smart home automation applications.

The global Pir Based Motion Detector market size was estimated at USD 485.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
