Abstracts

Piston corer is a scientific instrument used for collecting undisturbed sediment samples from the ocean floor or lake beds. It is designed to obtain cores with minimal disruption to the sediment layers, preserving the stratigraphy and integrity of the sample. The corer consists of a cylindrical tube with a cutting edge and a piston mechanism. The corer is lowered to the seabed or lake floor and driven into the sediment with a hydraulic or mechanical hammering system. As the corer penetrates the sediment, the piston mechanism is triggered, sealing the sample inside the tube to prevent mixing or loss during retrieval. Once the desired depth is reached, the corer is carefully lifted to the surface, keeping the sediment core intact. Piston corers are extensively used in geology, paleoclimate research, and environmental studies to extract sediment samples for analysis and dating.
