Report Overview

A Piston metering pump moves a precise amount of liquid during a specified time period yielding an accurate volumetric flow. A piston driven pump is a positive displacement method where the piston displaces the fluid in the reservoir chamber. Often piston pumps have two check valves on the inlet and outlet. As the piston recedes in the pumping chamber a negative pressure or vacuum is generated which opens the inlet check valve and pulls fluid towards the pumping chamber. Once fluid has filled the reservoir and the pump begins the discharge stroke, the piston pushes the fluid out of the fluid chamber through the outlet and through the outlet check valve.
