Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PLA Matte Wire competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PLA Matte Wire is a 3D printing consumable based on modified PLA (polylactic acid) material. It has a matte surface effect, is delicate and has no layered texture, has a weak overall plastic texture, and has a high-end visual effect. This material increases the light absorption by adding an appropriate amount of matte factor as a filler in the formula, causing the light to diffusely reflect on the surface of the wire, thus presenting a unique matte texture and high-end texture. It is used in creative design, hand-made model making, decorations and other fields, and can print large-size models.

The global PLA Matte Wire market size was estimated at USD 84.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.70% during the forecast period.
