Polylactic acid vascular stent is a vascular stent made of polylactic acid, a biodegradable material. Polylactic acid is a biodegradable polymer that can be degraded into non-toxic lactic acid by enzymes in the body, and then metabolized and excreted by the body. This property enables the polylactic acid vascular stent to gradually degrade and be absorbed by the human body after completing its task of supporting and repairing blood vessels, avoiding the problem of traditional metal stents needing to remain in the body for a long time.

The global PLA Vascular Scaffold market size was estimated at USD 231.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
