Report Overview:

A planet rover is a planetary surface exploration device designed to move over solid surfaces on planets or other planetary-mass objects. Some rovers are designed as land vehicles to transport human spaceflight crews; others are partially or fully autonomous robots. The mission of rovers that land on another planet (other than Earth), usually via lander-style spacecraft, is to gather information about the terrain and take samples of the crust, such as dust, soil, rocks, and even liquids. They are essential tools in space exploration.

The rover arrives on the spacecraft and uses it in very different conditions than on Earth, which places some demands on its design.

The rovers must withstand high levels of acceleration, high and low temperatures, pressure, dust, corrosion, cosmic rays, and remain functional for the required period of time without the need for repairs.

The Global Planet Rover Market Size was estimated at USD 513.71 million in 2023 and is projected to reach USD 653.77 million by 2029, exhibiting a CAGR of 4.10% during the forecast period.
