Abstracts

Planetary geared motors are mechanical devices that combine an electric motor with a planetary gear system, offering a compact, high-torque, and efficient solution for applications requiring precise speed reduction and power transmission. Characterized by their concentric design?where multiple planet gears revolve around a central sun gear within an outer ring gear?these motors excel in distributing load across multiple contact points, resulting in higher torque capacity, reduced backlash, and improved durability compared to traditional gear systems. Commonly used in industries such as robotics, automotive, aerospace, industrial automation, and renewable energy, planetary geared motors are valued for their ability to handle heavy loads, operate smoothly at low speeds, and maintain efficiency even under demanding conditions, making them integral to systems where reliability, space constraints, and performance are critical.

The global Planetary Geared Motors market size was estimated at USD 2885.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
