Abstracts

Planetary roller screws are primarily composed of the screw shaft, rollers, nut, internal gear ring, cage, and elastic retaining ring. By meshing the rollers with the screw shaft, they convert rotational motion into linear motion. These screws are widely used in the linear joints of humanoid robots. Due to their high torque density and precise transmission design, planetary roller screws are particularly effective in enhancing the torque density of leg joints, providing powerful output in a compact space. This results in improved movement accuracy and flexibility for the robot's joints.
