## Abstracts

A plant-based incomplete protein is a type of protein derived from plant sources that does not contain all nine essential amino acids in sufficient amounts required by the human body. Unlike complete proteins, which provide all essential amino acids (often found in animal products), incomplete proteins may lack one or more of these amino acids. Common sources of incomplete proteins include grains, legumes, nuts, seeds, and vegetables. While individuals can still obtain adequate protein from these sources, it often requires combining different plant foods (such as beans and rice) to achieve a complete amino acid profile. This approach is important for vegetarians and vegans to ensure they meet their nutritional needs.

The global Plant-based Incomplete Protein market size was estimated at USD 5041.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
