Report Overview:

Plant-based Protein Powders refers to the proteins extracted from plants like soybean, wheat, rice, pea, etc. The protein is an important component of human cells, consisting of monomers called amino acids. Vegetable protein is an alternative to animal protein and it can be absorbed easily. Protein is important to human body. Most people require about 0.8 grams of protein per kilogram of body weight, or about 58 grams of protein per day for a 160-pound adult.

The difference between the animal protein and Plant-based Protein Powders lies in the amino acid content. Animal proteins are called complete proteins because they contain all essential amino acids. Animal protein has the amino acids that the body is unable to synthesize and must be included in the diet to allow for the proper conduct of protein synthesis. Vegetable protein composition does not provide all the amino acids. Unlike animal proteins, Plant-based Protein Powders are low in fat and produce nitrogenous waste, which is the waste products of proteins, which should be less harmful to avoid overloading the kidneys.

The Global Plant-based Protein Powders Market Size was estimated at USD 5922.97 million in 2023 and is projected to reach USD 8497.41 million by 2029, exhibiting a CAGR of 6.20% during the forecast period.
