Abstracts

Plant exogenous hormones are synthetic or naturally derived substances applied externally to plants to regulate various physiological processes and promote growth. These hormones, which include auxins, gibberellins, cytokinins, ethylene, and abscisic acid, can influence a range of functions such as cell division, elongation, fruit ripening, and stress responses. By mimicking or enhancing the effects of natural plant hormones, exogenous hormones are used in agricultural practices to improve crop yield, control flowering and fruit development, and enhance overall plant health, making them valuable tools in horticulture and crop management.

The global Plant Exogenous Hormones market size was estimated at USD 5027.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
