## Abstracts

Plant Fiber Packaging is an environmentally friendly packaging material made from natural plant fibers (including non-wood resources such as wood, bamboo, crop straw, and hemp) through mechanical separation, chemical treatment, or biodegradation. The fibers are then extracted through pulping, molding, compounding, or direct weaving. Its core features are renewable raw materials, low carbon emissions during production, and biodegradable products (degradation rate exceeding 90%). Furthermore, through structural optimization (such as honeycomb and nano-reinforcement), it can achieve mechanical properties comparable to traditional plastics/foams. Ultimately, it is formed into a variety of forms, including paperboard, pulp molding, fiber composites, and natural fiber products. It is widely used in e-commerce logistics, food and medicine, electronics, and other fields, becoming a key solution to replace disposable petroleum-based packaging and promote the development of a circular economy.

The global Plant Fiber Packaging market size was estimated at USD 548.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
