Abstracts

Plant genetic engineering services involve the targeted modification of plant genetic material using modern molecular biology techniques, including gene cloning, vector construction, genetic transformation (such as Agrobacterium-mediated transfection and gene gun therapy), and transgenic plant screening and identification. These services aim to cultivate transgenic plants with desirable traits such as insect resistance, disease resistance, stress tolerance, high yield, or improved nutrition. These services are widely used in agricultural research, crop breeding, and biopharmaceuticals to improve crop yield and quality and enhance their adaptability to environmental conditions. In recent years, the plant genetic engineering service industry has developed rapidly with breakthroughs in molecular biology and gene editing technologies (such as CRISPR/Cas9). It has formed a professional service system covering gene cloning, genetic transformation, molecular detection and trait evaluation. It is mainly promoted by scientific research institutions, biotechnology companies and agricultural enterprises, and is widely used in crop stress resistance breeding, functional gene research and biopharmaceuticals. Although the global market continues to expand, especially driven by the demand for genetically modified crops and gene editing breeding, the industry still faces challenges such as strict biosafety supervision, differences in public acceptance and intellectual property barriers. Currently, North America and Europe are leading in technology, and emerging markets such as China and India are accelerating their layout. The overall market is technology-driven, policy-sensitive and application-oriented.

The global Plant Genetic Engineering Services market size was estimated at USD 629.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
