Abstracts

Plasma derived therapies are a specialized class of biologic medicines derived from human plasma, primarily used to treat rare, chronic, and often life-threatening conditions caused by deficiencies or dysfunctions in plasma proteins. These therapies include immunoglobulins (for immune deficiencies and autoimmune disorders), albumin (for hypovolemia and burns), clotting factors (such as Factor VIII and IX for hemophilia), and alpha-1 antitrypsin (for genetic emphysema), among others. The production process involves large-scale plasma collection through donation, rigorous screening and testing for pathogens, followed by fractionation and purification to isolate specific proteins, ensuring both therapeutic efficacy and safety. These products are indispensable in clinical settings due to their targeted mechanism of action and the lack of alternatives for many of the conditions they address.

The global Plasma Derived Therapies market size was estimated at USD 22150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.55% during the forecast period.
