Abstracts

A plasma engine is an electric propulsion system that generates thrust by accelerating a plasma-like working fluid using an electric current or potential. Unlike traditional chemical rockets, it typically does not rely on combustion chemical reactions. Instead, it uses electrical energy to ionize a propellant (such as an inert gas or solid working fluid like xenon) into a plasma, which is then accelerated and ejected using electromagnetic fields to generate thrust. These engines are renowned for their high specific impulse, long life, and precise thrust control, making them particularly well-suited for spacecraft attitude control, orbit maintenance, drag compensation, and deep space exploration missions. The plasma engine industry chain is a high-end, technology- and capital-intensive manufacturing chain. The upstream of the plasma engine industry chain is mainly composed of suppliers of core raw materials and components such as plasma generators, radio frequency power systems, plasma-resistant special materials (such as special ceramics) and rare gases; the midstream is the engine manufacturing and system integration link, which involves integrating upstream components into a complete propulsion system; the downstream is widely used in cutting-edge fields such as aerospace propulsion and space science experiments.

The global Plasma Engine market size was estimated at USD 4022.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
