Abstracts

Plasma gasification waste recycling is a waste treatment technology that uses high-temperature plasma torches to convert solid waste into a synthetic gas (syngas) and a solid residue called slag. The process involves subjecting the waste materials to extremely high temperatures (up to 10,000 degrees Fahrenheit) in a plasma gasifier. The intense heat breaks down the waste into its constituent elements, which are then reformed into syngas. The syngas can be used as a fuel for electricity generation or as a raw material for chemical production.

The global Plasma Gasification Waste Recycling market size was estimated at USD 105.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
