## Abstracts

Plasma pen is a term used to describe Thierry's plasma surface treatment systems. Plasma pens are capable of creating plasma which is utilized to alter the characteristics of surfaces. Plasma is formed inside plasma pens by creating a vacuum inside a chamber. Then a very small amount of gas is channeled into the chamber that changes phases from gas to plasma when its molecules become ionized. Inside the chamber of plasma pens, surfaces get bombarded by plasma ions modifying the surface on a very small scale. These plasma processes usually change the surface by enhancing their adhesion capabilities and getting rid of any impurities the surface may have had. Instead of the plasma being created in a chamber, it is created within a nozzle and is then expelled out in a stream of compressed air creating a plasma beam. Growing demand for smart manufacturing, 4K display, smart lighting, and 3D storage devices is driving the RF plasma generator market. Increasing use of innovative circuit design techniques to deliver plasma sources for long-term reliability and improved performance is driving the market. Increasing adoption of RF plasma generators to ensure transistors operate at optimum voltage and manage current to maximize voltage breakdown margin is driving the market. RF plasma generators contain large and heavy devices and require more electricity to operate, which is further extracted as heat in the form of waste, hindering the market. Rising demand for connected devices coupled with increasing deployment of the Internet of Things (IoT) is creating opportunities for the market.

The global Plasma Pens market size was estimated at USD 1613.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.20% during the forecast period.
