Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Plastic Anti-Aging Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Plastic anti-aging agents are chemical additives used to improve the durability and longevity of polymer-based materials by protecting them from degradation caused by environmental factors such as heat, oxygen, and ultraviolet (UV) radiation. These agents play a critical role in maintaining the mechanical, thermal, and visual properties of plastics over time. There are two primary types of plastic anti-aging agents: antioxidants and UV stabilizers. Antioxidants prevent thermal and oxidative degradation during processing and end-use by scavenging free radicals, while UV stabilizers mitigate the harmful effects of sunlight by absorbing or reflecting UV rays. By incorporating these agents into resin formulations, manufacturers can significantly extend the useful life of plastic products in both indoor and outdoor environments.

Application Areas and Material Compatibility Plastic anti-aging agents are widely used across various resin systems, including polyethylene (PE), polypropylene (PP), polyvinyl chloride (PVC), polycarbonate (PC), polyethylene terephthalate (PET), and polystyrene (PS). Each polymer type has unique vulnerabilities to environmental stress, and the appropriate selection and dosage of anti-aging agents depend on the polymer's stability profile and the intended application. For example, PE and PP, which are commonly used in packaging, automotive, and infrastructure applications, benefit from combined antioxidant and UV stabilizer systems to resist cracking, discoloration, and brittleness under prolonged exposure. PVC, which is prone to thermal degradation, particularly during processing, often requires heat stabilizers in combination with antioxidants. PET and PC, frequently used in electronic components and optical products, demand high-purity stabilizers to maintain transparency and electrical

properties. As plastic materials are increasingly used in demanding outdoor and high-temperature environments, the integration of advanced anti-aging agents becomes essential for quality assurance and performance reliability. **Market Trends and Future Outlook**

The global Plastic Anti-Aging Agent market size was estimated at USD 3450.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.00% during the forecast period.
