### Report Overview

The plastic back pressure valve is used to prevent the self flow or siphon of liquid under the action of gravity. At this time, the back pressure valve can reduce the flow and pressure fluctuation caused by siphon. When the pressure of the plastic back pressure valve is unstable in the pipeline or equipment container, the plastic back pressure valve can maintain the pressure required by the pipeline and enable the pump to output the flow normally. In addition, siphon often occurs at the outlet of the pump due to gravity or other effects. At this time, the back pressure valve can reduce the fluctuation of flow and pressure caused by siphon. For volumetric pumps such as metering pumps, excessive delivery will occur when they work under low system pressure. The plastic back pressure valve can avoid similar problems.
