## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Plastic Laser Welding System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Non-contact laser welding offers several advantages when it comes to joining one plastic part to another. It works on the principle of partial transmission which lets a laser's light travel through one of the plastic parts to create heat and fuse or weld it to a second plastic part. The finished weld is contained between the parts. There is also no contact between the fused area and the heat source or atmosphere, so the finished joint is clean. Conventional plastic welding techniques such as ultrasonic and hot stamping, on the other hand, require contact with the outer surfaces of the parts being joined, and this can contaminate the joint and the parts' surfaces or mechanically damage the assembly. Global key players of Laser Plastic Welding System include Han's Laser, Trumpf, LPKF Laser & Electronics, United Winners Laser, Emerson Electric, etc. The top five players hold a share about 45%. Asia-Pacific is the largest market, and has a share about 39%, followed by Europe and North America with share 30% and 21%, separately. In terms of product type, Fiber Laser Welding System is the largest segment, occupied for a share of 40%. In terms of application, Automotive has a share about 47%.

The global Plastic Laser Welding System market size was estimated at USD 387.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
