Abstracts

A plastic pyrolysis machine is a specialized industrial system designed to thermally decompose plastic waste in an oxygen-free or low-oxygen environment, converting it into valuable outputs such as fuel oil, syngas, and carbon black through a process known as pyrolysis, which breaks down long-chain polymer molecules at elevated temperatures typically ranging from 300°C to 900°C depending on the feedstock and technology used. These machines are engineered to handle various types of plastic waste, including polyethylene, polypropylene, and polystyrene, and are increasingly recognized as a key technology in advancing circular economy initiatives by transforming non-recyclable plastic into reusable resources, thereby reducing landfill burden and fossil fuel dependency while addressing environmental pollution challenges.

The global Plastic Pyrolysis Machine market size was estimated at USD 1250.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
