## Abstracts

Plastic pyrolysis oil is a synthetic fuel derived from the thermal decomposition of plastic waste in an oxygen-limited environment, a process known as pyrolysis, which breaks down long-chain polymers into shorter hydrocarbon chains. This oil typically exhibits properties similar to conventional diesel or heavy fuel oil, though its composition can vary depending on the feedstock plastics and process conditions, often containing impurities such as chlorine, sulfur, or solid residues that require further refining. As a product, it represents a form of chemical recycling, converting non-recyclable plastic waste into an energy resource or feedstock for further industrial use, thereby addressing both waste management challenges and demand for alternative fuels.

The global Plastic Pyrolysis Oil market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
