Abstracts

A railroad tie is rectangular block of support used in the railways for rail tracks. Railroad ties are beneficial in transferring the load to the rail track ballast while holding the tracks intact. Composite railroad tie is produced from recycled materials such as plastic and rubber, which makes it environment-friendly. Composite railroad tie has proven to outperform traditional tie materials due to its properties such as resistant to several weather conditions and anti-corrosive. A composite railroad tie does not crumble or decompose over time. Composite railroad tie is also moisture-resistant and immune towards infestation by insects. According to the data of China Association of Metros, by the end of 2022, 55 cities in mainland China have opened urban rail transit and 308 operating lines. The total length of operating lines is 10287.45 km, ranking first in the world and accounting for 26.2% of the total global mileage. 1080.63 km of new operating lines were added in 2022. By the end of 2022, 545 cities in 78 countries and regions will have opened urban rail transit, with more than 41,386.12 km of operational mileage. Compared to 2021, the total mileage of urban rail transit worldwide would increase by 4,531.92 km, an increase of 11.0%, of which 1,293.45 km of subway mileage, 788.11 km of light rail mileage and 2,450.36 km of tram mileage would increase, accounting for 28.5%, 17.4% and 54.1% of the total increase respectively.
