Report Overview

Plastisol is a suspension of PVC or other polymer particles in a liquid plasticizer; it flows as a liquid and can be poured into a heated mold. When heated to around 177 degrees Celsius, the plastic particles dissolve and the mixture turns into a gel of high viscosity that usually cannot be poured anymore. On cooling below 60 degrees C, a flexible, permanently plasticized solid product results.[1] Aside from molding, plastisol is commonly used as a textile ink for screen-printing and as a coating, particularly in outdoor applications (roofs, furniture) and dip-coating.

Textile industry is the largest market for plastisols in 2017, and will continue its dominance throughout the forecast period. Plastisols find applications in textile products such as industrial fabrics, apparels, personal protective equipment, home furnishing, footwear, laminated textile, and others. Plastisols are also widely used as textile printings inks in the textile industry.
