### Report Overview

Plated Through Hole Prototyping Board is a circuit board for electronic prototype development and testing, with plated through hole and through hole structure.

Features of plated through hole prototype boards include:

**Through hole structure:** The prototype board has a series of through holes, which are used to mount and connect electronic components, such as resistors, capacitors, integrated circuits, etc. Vias allow electronic components to make electrical connections between different layers.

**Perforated structure:** The perforated holes on the prototype board are usually for the convenience of installing and fixing the prototype board, such as studs, threaded holes or other accessories.

**Plated:** Unlike unplated through-hole prototype boards, plated through-hole through-hole prototype boards are electroplated, meaning that the walls of the holes are coated with a layer of metal, usually copper. This plating provides electrical connectivity and reliability to ensure signal transmission and connection of electronic components.

Plated through-hole through-hole prototype boards are often used in the electronic prototyping and functional verification stages. Plated through-holes provide a stable electrical connection that supports higher frequency and higher current applications. Engineers can quickly build and test circuits, evaluate performance, and debug on the prototyping board.
