Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Plated Truss Connector competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Plated truss connector is a metal connector used to connect wood components (such as upper and lower chords and webs) into an integral truss structure. It is usually stamped from high-strength steel plates and treated with galvanizing, aluminum-zinc plating or galvanized aluminum-magnesium alloy to improve its corrosion resistance and structural stability. This type of connector is covered with stamped teeth on the surface, which can be mechanically pressed into the wood to achieve high-strength bite without the need for bolts or adhesives. It is widely used in the manufacture of industrialized roof trusses, floor systems and prefabricated wood structural components. Its design complies with international standards such as ASTM A653 and EN 14545. It has the advantages of high load-bearing capacity, quick installation, high tensile and shear strength, etc. It is an indispensable connection element in modern wood structure buildings, especially suitable for standardized structural systems in residential, commercial buildings and light industrial plants.

The global Plated Truss Connector market size was estimated at USD 133.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
