Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Platelet Alumina competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Platelet alumina is a type of aluminum oxide powder with a unique flat, hexagonal, plate-like crystal structure that is made by a special high-temperature calcination process. This tabular shape gives it specific properties, like a "gliding lapping effect" that provides superior polishing and a reduced risk of scratches on the surface of the material being worked on, making it ideal for applications like polishing semiconductor chips or electronic components. It's also used as a filler in cosmetics and other advanced materials due to its high hardness and other beneficial properties. In 2024, global production of Platelet Alumina reached 160 k tons, with an average selling price of US\$7.62/kg. A typical single-line production capacity is approximately 1,000-3,000 tons per year, and the industry's gross profit margin is approximately 20%-30%. Direct materials account for about 55%, manufacturing costs about 35%, and labor costs about 10%. The industry chain includes upstream bauxite/alumina, chemical reagents, and energy (electricity), and downstream products such as pearlescent pigments, precision polishing materials, functional coatings, high-performance ceramics, composite materials, and cosmetics.

The global Platelet Alumina market size was estimated at USD 122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
