Report Overview

Platform Edge Doors (PEDs) are physical barriers installed along the edges of railway or metro platforms to enhance passenger safety by preventing accidental falls onto the tracks, unauthorized access, and suicide attempts. These systems are synchronized with train doors to open and close only when a train is correctly aligned and stopped at the station, improving operational efficiency and reducing delays caused by platform-related incidents. PEDs are commonly used in high-traffic urban transit systems, airports, and automated people mover (APM) networks, with variations including full-height, half-height, and screen door designs depending on safety requirements and station infrastructure. Their adoption is driven by urbanization, increasing demand for mass transit safety, and regulatory standards emphasizing passenger protection.
