Report Overview

Platinised Niobium Anodes are specialized metal electrodes used in various electrochemical processes. These anodes are made from niobium, a transition metal known for its high melting point, ductility, and resistance to corrosion. The term "platinised" refers to the process of coating or plating the surface of the niobium with platinum, a highly conductive and chemically inert metal. This plating enhances the anode's performance by improving its catalytic properties, reducing the overpotential required for certain reactions, and increasing its resistance to corrosion. Platinised niobium anodes are commonly used in applications such as electroplating, electro-winning, and electrochemical synthesis, where their combination of strength, conductivity, and chemical stability is beneficial.
