Report Overview

Platinised Titanium Anodes are specialized electrochemical components utilized in various industrial processes, particularly in the chlor-alkali industry and water treatment facilities. These anodes are made from titanium, a corrosion-resistant metal, which is coated with a thin layer of platinum to enhance their catalytic properties. The platinum coating improves the efficiency of the electrode by reducing the overvoltage required for the electrolysis process, thereby lowering energy consumption and increasing the lifespan of the anode. Platinised titanium anodes are designed to resist corrosion and maintain their performance over extended periods, making them a preferred choice for applications where high purity and reliability are crucial. They play a critical role in the production of chlorine, caustic soda, and other chemicals, as well as in the purification of water by removing harmful contaminants through processes like electrocoagulation.
