Abstracts

Platinized titanium anodes are specialized electrodes used primarily in industrial electrochemical processes, consisting of a titanium substrate coated with a thin layer of platinum or platinum-group metals to enhance electrical conductivity, corrosion resistance, and catalytic activity. These anodes are critical in applications such as electrolysis, cathodic protection, electroplating, chlorine production, and wastewater treatment, where their durability and efficiency in harsh chemical environments offer significant advantages over traditional materials like graphite or lead-based anodes. The platinized layer ensures stable performance over extended periods, reducing maintenance costs and operational downtime, while the titanium core provides mechanical strength and lightness, making them suitable for both submerged and high-temperature operations.

The global Platinized Titanium Anode market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
