Abstracts

A platinum-clad anode is an electrode consisting of a base metal (like titanium or niobium) coated with a thin layer of platinum. This design combines the cost-effectiveness and mechanical strength of the base metal with the excellent corrosion resistance and electrocatalytic properties of platinum. The platinum layer provides a highly durable and efficient surface for electrochemical reactions, making these anodes ideal for harsh environments and applications requiring high performance. They are used in processes like electroplating, water treatment, and cathodic protection, where longevity and reliability are crucial. The platinum-clad anode industry is influenced by upstream platinum and base metal prices. Downstream, demand is driven by increasing environmental regulations in water treatment and the growth of the electronics and chemical industries. Product specifications are trending towards thinner, more uniform platinum coatings and improved bonding techniques for enhanced durability. The future market size is expected to grow, fueled by the need for advanced electrochemical solutions in sustainable technologies, like hydrogen production and wastewater treatment. The development of new alloys within the cladding is also a growing trend.

The global Platinum Clad Anode market size was estimated at USD 319.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
