Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Platinum Thermal Resistor Element competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Platinum thermal resistor elements are a type of high-precision temperature sensor element that is widely used in industry and scientific research. The basic principle is that the resistance value of metal platinum will change regularly when the temperature changes. Specifically, as the temperature rises, the resistance value of platinum will increase in an approximately linear manner. This resistance-temperature characteristic has good repeatability and stability over a wide temperature range. Compared with other metal materials, platinum has extremely high chemical inertness and oxidation resistance, is not easily corroded or reacts with other substances, and can work for a long time in high temperature and highly corrosive environments with stable performance; at the same time, its physical properties (such as conductivity, ductility, and thermal stability) are also very excellent, and its consistency in the resistance-temperature curve makes it the preferred material for manufacturing thermal resistor sensors.

The global Platinum Thermal Resistor Element market size was estimated at USD 2488.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
