Abstracts

Platter substrate materials refer to the foundational materials used in the manufacturing of hard disk drive (HDD) platters, which are the rotating disks where digital data is magnetically stored; these substrates must exhibit exceptional properties such as high rigidity, low thermal expansion, superior smoothness, and non-magnetic characteristics to ensure precise data recording, longevity, and reliability. Commonly utilized materials include aluminum alloys coated with nickel-phosphorus (NiP) for traditional HDDs, glass or glass-ceramic composites for enterprise and high-performance applications due to their enhanced stability and resistance to thermal deformation, and increasingly advanced materials like silicon or carbon-based composites in emerging technologies aimed at pushing aerial density limits and improving shock resistance. The selection of substrate material is critical, as it directly influences the drive's performance, storage capacity, durability, and overall cost structure, making it a key focus area for innovation within data storage hardware manufacturing.

The global Platter Substrate Materials market size was estimated at USD 180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
