Report Overview

The plug-in motion controller is a device that integrates motion control functions on a plug-in card, which can be plugged into the PCI or PCIe bus of the computer to control the stepper motor or servo motor. The plug-in motion controller can output pulse or analog commands, support point and continuous trajectory, multi-axis synchronization, linear, arc, helical, space linear interpolation and other motion modes. The plug-in motion controller can freely set parameters such as acceleration and deceleration, S-curve smoothness, etc., to help users design the most suitable motion plan for the mechanical structure. Through the library files provided by the plug-in motion controller, users can program the controller in different development environments to build an automatic control system.
