Abstracts

A pneumatic booster pump is a specialized fluid handling device that uses compressed air as its power source to amplify fluid pressure, typically by employing a large-area air piston driving a smaller-area hydraulic piston to achieve pressure multiplication ratios that can reach several hundred times the input air pressure. These pumps are designed to generate high hydraulic or pneumatic output pressures, often in the range of thousands of psi or bar, and are widely used in applications requiring precise, reliable, and safe pressure intensification, such as in hydrostatic testing, clamping systems, valve actuation, and industrial processes where electricity may pose a hazard or where consistent high-pressure output is critical.

The global Pneumatic Booster Pump market size was estimated at USD 345.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
