Report Overview

Pneumatic cylinders are mechanical devices which use the power of compressed gas to produce a force in a reciprocating linear motion.

Pneumatic Cylinders types mainly include Single-acting cylinders (SAC) and Double-acting cylinders (DAC).

Single-acting cylinders (SAC) use the pressure imparted by compressed air to create a driving force in one direction (usually out), and a spring to return to the 'home' position. More often than not, this type of cylinder has limited extension due to the space the compressed spring takes up. Another downside to SACs is that part of the force produced by the cylinder is lost as it tries to push against the spring.

Double-acting cylinders (DAC) use the force of air to move in both extend and retract strokes. They have two ports to allow air in, one for outstroke and one for instroke. Stroke length for this design is not limited, however, the piston rod is more vulnerable to buckling and bending.

Global Pneumatic Cylinder key players include SMC Corporation, Festo, IMI, Parker, etc. Global top four manufacturers hold a share about 40%.

Europe is the largest market, with a share over 30%, followed by China, and North America, both have a share about 45 percent.

In terms of product, Single-Acting Cylinders is the largest segment, with a share over 35%. And in terms of application, the largest application is Industrial realm, followed by Automotive, Building, etc.
