### Report Overview:

Pneumatic springs are metal bellows filled with compressed air used as an alternative to the metal wire springs used to close valves in high-speed internal combustion engines. These could retract valves more quickly and reduce the possibility of piston-valve interference, as long as pressure could be maintained. Additionally, the amount of seat tension required to keep a coil sprung valve under control results in greater peak lift loading. This results in added stress to the entire valvetrain. Pneumatic systems, sharing a common reservoir of pressure retain a more static level of force, controlling the valve effectively, without any attendant peak lift load increase.

The Global Pneumatic Springs Market Size was estimated at USD 2253.38 million in 2023 and is projected to reach USD 2834.84 million by 2029, exhibiting a CAGR of 3.90% during the forecast period.
