Abstracts

A pneumatic volume booster is a specialized pneumatic device designed to amplify the flow capacity of a control signal while maintaining the input pressure level, enabling the rapid actuation of large-volume pneumatic actuators, cylinders, or other high-flow components in automated systems; it functions by using a low-flow pilot signal to control a high-flow output, effectively acting as an interface between a precision control device (such as a regulator or positioner) and a process requiring greater air volume for faster response times, making it essential in industries where speed, synchronization, and efficient air usage are critical.
