Abstracts

Pneumoconiosis treatment refers to the medical and therapeutic interventions aimed at managing the progression and symptoms of pneumoconiosis, a group of interstitial lung diseases caused by the inhalation of dust particles, such as coal, silica, asbestos, or other mineral dusts, which lead to chronic inflammation, fibrosis, and irreversible lung damage. Treatment approaches are primarily supportive rather than curative and include pharmacological therapies like corticosteroids or immunosuppressants to reduce inflammation, bronchodilators to alleviate breathing difficulties, oxygen therapy to address hypoxemia, and pulmonary rehabilitation to improve physical conditioning and quality of life. In advanced cases, lung transplantation may be considered. The focus is on halting further exposure, managing complications such as respiratory infections or pulmonary hypertension, and providing palliative care, as the disease is often progressive and irreversible once established.

The global Pneumoconiosis Treatment market size was estimated at USD 122.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
