Abstracts

Pocket Ophthalmoscope is a small portable medical device used to examine the internal structure of the eye, especially the retina, optic nerve papilla, and fundus blood vessels. It is usually equipped with a light source and a lens system that enables the microscopic structure of the fundus to be viewed through the pupil, helping doctors or medical professionals to quickly assess eye health. Because of its compact size and light weight, the pocket ophthalmoscope is often used in clinical diagnosis, emergency examination or on-site medical evaluation, especially for the need to quickly identify retinopathy, glaucoma, diabetic retinopathy and other eye diseases. Its operation usually needs to be carried out in a dark room or under natural light to ensure clarity and accuracy of observation.

The global Pocket Ophthalmoscope market size was estimated at USD 71.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
