## Abstracts

Polarizing stress tester is a device used to detect the birefringence of transparent and weakly colored materials. It mainly consists of a light source, a polarizer, an analyzer, a light intensity detector, a computer control system, etc. The polarizing stress tester uses the principle of polarized light interference to detect stress through the birefringence phenomenon produced when polarized light passes through the material to be measured. When there is stress inside the material, its isotropic nature will be destroyed, resulting in different refractive indexes in the two principal stress directions, resulting in birefringence, and the stress value of the material can be calculated.

The global Polarizing Stress Tester market size was estimated at USD 148.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
