Abstracts

A pole - mounted capacitor bank is a crucial electrical device that is installed on utility poles in power distribution systems. Its primary function is to improve the power factor of the electrical network. These capacitor banks consist of multiple capacitors grouped together in a single enclosure. By providing reactive power compensation, they help reduce the amount of reactive power flowing through the distribution lines. This, in turn, minimizes energy losses and voltage drops in the system. Pole - mounted capacitor banks are designed to be easily installed and maintained on poles, often in areas where they can effectively serve nearby loads. They play a significant role in enhancing the efficiency of the electrical distribution infrastructure, ensuring that electricity is delivered more reliably and with better quality to consumers. Their presence helps utilities optimize power usage, cut down on operational costs, and support the overall stability of the electrical grid.

The global Pole-mounted Capacitor Bank market size was estimated at USD 351.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
